

Astronomía de Posición

Q1. 2013-9

$$\cos(90^\circ - \delta) = \cos(z) \cos(90^\circ - \varphi) + \sin(z) \sin(90^\circ - \varphi) \cos(180^\circ - A)$$

$$\sin \delta = \cos z \sin \varphi - \sin z \cos \varphi \cos A$$

$$\delta = \arcsin(\cos 30^\circ \sin 40^\circ - \sin 30^\circ \cos 40^\circ \cos 50^\circ)$$

$$\delta = 18^{\circ} 05' 14.87''$$

$$\frac{\sin H}{\sin Z} = \frac{\sin(180^\circ - A)}{\sin(90^\circ - \delta)}$$

$$H = \arcsin\left(\frac{\sin A \sin z}{\cos \delta}\right)$$

$$H = 23.762^\circ$$

$$H = 1^h \ 35^m \ 2.81^s$$
